GRADE 96.66%

Autonomous driving (case study)

LATEST SUBMISSION GRADE 96.66%

1. To help you practice strategies for machine learning, in this week we'll present another scenario and ask how you would act. We think this "simulator" of working in a machine learning project will give a task of what leading a machine learning project could be like!

1 / 1 point

You are employed by a startup building self-driving cars. You are in charge of detecting road signs (stop sign, pedestrian crossing sign, construction ahead sign) and traffic signals (red and green lights) in images. The goal is to recognize which of these objects appear in each image. As an example, the above image contains a pedestrian crossing sign and red traffic lights

ſοΊ "stop sign" 1 "pedestrian crossing sign" 0 "construction ahead sign" 1 "red traffic light" 0 "green traffic light"

Your 100,000 labeled images are taken using the front-facing camera of your car. This is also the distribution of data you care most about doing well on. You think you might be able to get a much larger dataset off the internet, that could be helpful for training even if the distribution of internet data is not the

You are just getting started on this project. What is the first thing you do? Assume each of the steps below would take about an equal amount of time (a few days).

- Spend a few days training a basic model and see what mistakes it makes.
- Spend a few days getting the internet data, so that you understand better what data is available.
- O Spend a few days collecting more data using the front-facing camera of your car, to better understand how much data per unit time you can collect.
- O Spend a few days checking what is human-level performance for these tasks so that you can get an accurate estimate of Bayes error.

✓ Correct

As discussed in lecture, applied ML is a highly iterative process. If you train a basic model and carry out error analysis (see what mistakes it makes) it will help point you in more promising directions

2. Your goal is to detect road signs (stop sign, pedestrian crossing sign, construction ahead sign) and traffic signals (red and green lights) in images. The goal is to recognize which of these objects appear in each image. You plan to use a deep neural network with ReLU units in the hidden layers.

1 / 1 point

For the output layer, a softmax activation would be a good choice for the output layer because this is a multi-task learning problem. True/False?

○ True

False

✓ Correct

Softmax would be a good choice if one and only one of the possibilities (stop sign, speed bump, pedestrian crossing, green light and red light) was present in each image.

3. You are carrying out error analysis and counting up what errors the algorithm makes. Which of these datasets do you think you should manually go through and carefully examine, one image at a time?

1/1 point

- 500 images on which the algorithm made a mistake
- 500 randomly chosen images
- 10,000 randomly chosen images
- 10,000 images on which the algorithm made a mistake

✓ Correct

Focus on images that the algorithm got wrong. Also, 500 is enough to give you a good initial sense of the error statistics. There's probably no need to look at 10,000, which will take a long

After working on the data for several weeks, your team ends up with the following data:

• 100,000 labeled images taken using the front-facing camera of your car.

- 900,000 labeled images of roads downloaded from the internet.
- Each image's labels precisely indicate the presence of any specific road signs and traffic signals or

combinations of them. For example, $\boldsymbol{y}^{(i)}$ 0 means the image contains a stop sign and a red traffic light

Because this is a multi-task learning problem, you need to have all your $y^{(i)}$ vectors fully labeled. If one

example is equal to then the learning algorithm will not be able to use that example. True/False?

O True

False

✓ Correct

As seen in the lecture on multi-task learning, you can compute the cost such that it is not influenced by the fact that some entries haven't been labeled.

The distribution of data you care about contains images from your car's front-facing camera; which comes from a different distribution than the images you were able to find and download off the internet. How should you split the dataset into train/dev/test sets?

Mix all the 100,000 images with the 900,000 images you found online. Shuffle everything. Split the

 $1,\!000,\!000\,images\,dataset\,into\,600,\!000\,for\,the\,training\,set,\,200,\!000\,for\,the\,dev\,set\,and\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\!000\,for\,the\,dev\,set\,200,\,000\,for\,the\,dev\,set\,20$ the test set.

Mix all the 100,000 images with the 900,000 images you found online. Shuffle everything. Split the 1,000,000 images dataset into 980,000 for the training set, 10,000 for the dev set and 10,000 for the

 Choose the training set to be the 900,000 images from the internet along with 80,000 images from your car's front-facing camera. The 20,000 remaining images will be split equally in dev and test sets.

O Choose the training set to be the 900,000 images from the internet along with 20,000 images from your car's front-facing camera. The 80,000 remaining images will be split equally in dev and test sets.

✓ Correct

Yes. As seen in lecture, it is important that your dev and test set have the closest possible distribution to "real"-data. It is also important for the training set to contain enough "real"-data to avoid having a data-mismatch problem.

6. Assume you've finally chosen the following split between of the data:

Dataset:	Contains:	Error of the algorithm:
Training	940,000 images randomly picked from (900,000 internet images + 60,000 car's front-facing camera images)	8.8%
Training- Dev	20,000 images randomly picked from (900,000 internet images + 60,000 car's front-facing camera images)	9.1%
Dev	20,000 images from your car's front-facing camera	14.3%
Test	20,000 images from the car's front-facing camera	14.8%

You also know that human-level error on the road sign and traffic signals classification task is around 0.5%. Which of the following are True? (Check all that apply).

You have a large variance problem because your training error is quite higher than the human-level

You have a large variance problem because your model is not generalizing well to data from the same training distribution but that it has never seen before.

You have a large avoidable-bias problem because your training error is quite a bit higher than the human-level error.

Correct

You have a large data-mismatch problem because your model does a lot better on the training-dev set than on the dev set

1 / 1 point

Vour algorithm overfits the devise because the error of the deviand test sets are very close.		✓ Correct		
than the devitest distribution. What do you thin? Your friend is gright, (i.e., Bayes error for the training data distribution is probably lower than for the devitest distribution.) What friend is wrong (i.e., Bayes error for the training data distribution is probably higher than for the devitest distribution.) There's insufficient information to tell if your friend is right or wrong. Correct The algorithm does better on the distribution of data it trained on. But you don't know if it's because it trained on that no distribution or if it really is easier. To get a better sense, measure human-level error separately on both distributions. 8. You decide to focus on the dev set and check by hand what are the errors due to. Here is a table summarizing your discoveries: Devail dev set error Fron due to incorrectly labeled data Fron due to foggy pictures Fron due to rain drops stuck on your car's front-flaing camera Fron due to rain drops stuck on your car's front-flaing camera In this table, 4.1%, 8.0%, etc. are a fraction of the total dev set (not just examples your algorithm mislabeled). For example, about 8.015.3 = 52% of your errors are due to foggy pictures. The results from this analysis impliest hat the team's highest priority should be to bring more foggy pictures into the training set so as to address the 8.0% of errors in that category. True-False? Additional Note: there are subtle concepts to consider with this question, and you may find arguments for why some anaware are also correct or incorrect. We recommend that you spend time reading the feedback for this quit, to understand what issues that you will want to consider when you are building your own machine learning project. True because it is the largest category of errors. We should always prioritize the largest category of error as this will make the best use of the team's time. True because it depends on how easy it is to add foggy data. If foggy data is very hard and costly to coilect, it might not be worth the team's effort. First sta		Your algorithm overfits the dev set because the error of the dev and test sets are very of the dev and test	close.	
Your friend is wrong. (i.e., Bayes error for the training data distribution is probably higher than for the devitest distribution.) There's insufficient information to tell if your friend is right or wrong. ✓ Correct The algorithm does better on the distribution of data it trained on. But you don't know if it's because it trained on that no distribution or if it really is easier. To get a better sense, measure human-level error separately on both distributions. 8. You decide to focus on the dev set and check by hand what are the errors due to. Here is a table summarizing your discoveries: Overall dev set error Overall dev set error 15.3% Errors due to incorrectly labeled data Errors due to foggy pictures 8. 8.0% Errors due to ofggy pictures In this table, 4.1%, 8.0%, etc. are a fraction of the total dev set (not just examples your algorithm mislabeled). For example, about \$0.015.3 = 2.2% of your errors are due to foggy pictures. The results from this analysis implies that the team's highest priority should be to bring more foggy pictures into the training set to as to address the 8.0% of errors in that category. True/False? Additional Note: there are subtle concepts to consider with this question, and you may find arguments for why some answers are also correct or incorrect. We recommend that you spend time reading the feedback for this quit, bout onderstand what issues that you will want to consider when you are building your own machine learning project. True because it is the largest category of errors. We should always prioritize the largest category of error as this will make the best use of the team's time. True because it greater than the other error categories added together (8.0 > 4.1+2.2+1.0). False because it depends on how easy it is to add foggy data. If foggy data is very hard and costly to collect, it might not be worth the team's effort. First start with the sources of error that are least costly to fix. ✓ Correct correct: feedback: This is the correct answer. You should co	7.		n is much easier	1/1 point

You can buy a specially designed windshield wiper that help wipe off some of the raindrops facing camera. Based on the table from the previous question, which of the following states agree with?	on the front- ments do you	1/1 point
2.2% would be a reasonable estimate of how much this windshield wiper could worsen performance		performance. 2.2% would be a reasonable estimate of the minimum amount this windshield wiper co		
			performance.	
		2.2% would be a reasonable estimate of how much this windshield wiper could worsen		

10. You decide to use data augmentation to address foggy images. You find 1,000 pictures of fog off the internet, and "add" them to clean images to synthesize foggy days, like this:

1 / 1 point

✓ Correct

raindrops.

Yes. You will probably not improve performance by more than 2.2% by solving the raindrops problem. If your dataset was infinitely big, 2.2% would be a perfect estimate of the improvement you can achieve by purchasing a specially designed windshield wiper that removes the

13. Another colleague wants to use microphones placed outside the car to better hear if there're other vehicles around you. For example, if there is a police vehicle behind you, you would be able to hear their siren. However, they don't have much to train this audio system. How can you help?

 Transfer learning from your vision dataset could help your colleague get going faster. Multi-task learning seems significantly less promising.

Multi-tack learning from vour vision dataset could help vour colleague get going faster. Transfer

1 / 1 point

	learning seems significantly less promising.	
	Either transfer learning or multi-task learning could help our colleague get going faster.	
	Neither transfer learning nor multi-task learning seems promising.	
	Correct Yes. The problem he is trying to solve is quite different from yours. The different dataset structures make it probably impossible to use transfer learning or multi-task learning.	
14.	To recognize red and green lights, you have been using this approach:	1/1 point
	• (A) Input an image (x) to a neural network and have it directly learn a mapping to make a prediction as to whether there's a red light and/or green light (y).	
	A teammate proposes a different, two-step approach:	
	(B) In this two-step approach, you would first (i) detect the traffic light in the image (if any), then (ii) determine the color of the illuminated lamp in the traffic light.	
	Between these two, Approach B is more of an end-to-end approach because it has distinct steps for the input end and the output end. True/False?	
	○ True	
	False	
	Correct Yes. (A) is an end-to-end approach as it maps directly the input (x) to the output (y).	
15.	Approach A (in the question above) tends to be more promising than approach B if you have a $___$ (fill in the blank).	1 / 1 point
	Large training set	
	Multi-task learning problem.	
	C Large bias problem.	
	O Problem with a high Bayes error.	
	Correct Yes. In many fields, it has been observed that end-to-end learning works better in practice, but requires a large amount of data.
